

# If a picture is worth a thousand words, then... Picture Safety!

## New! Introducing the **PRODUCT RECOGNITION SAFETY LABEL**

Color-coded lids have been used for years to distinguish pails of warewashing detergents from pails of rinse aids and sanitizers. In the past, this color-coding was intended to guide employees in making the correct selection before changing containers of product.

In today's foodservice industry, however, color-coding is simply not enough. In fact, in some instances it could even be confusing.

That's why U S Chemical has developed a new identification tool: **The Product Recognition Safety Label**. In addition to color, the label highlights five important pieces of information that relate specifically to the use of the product and to the safety of your employees:

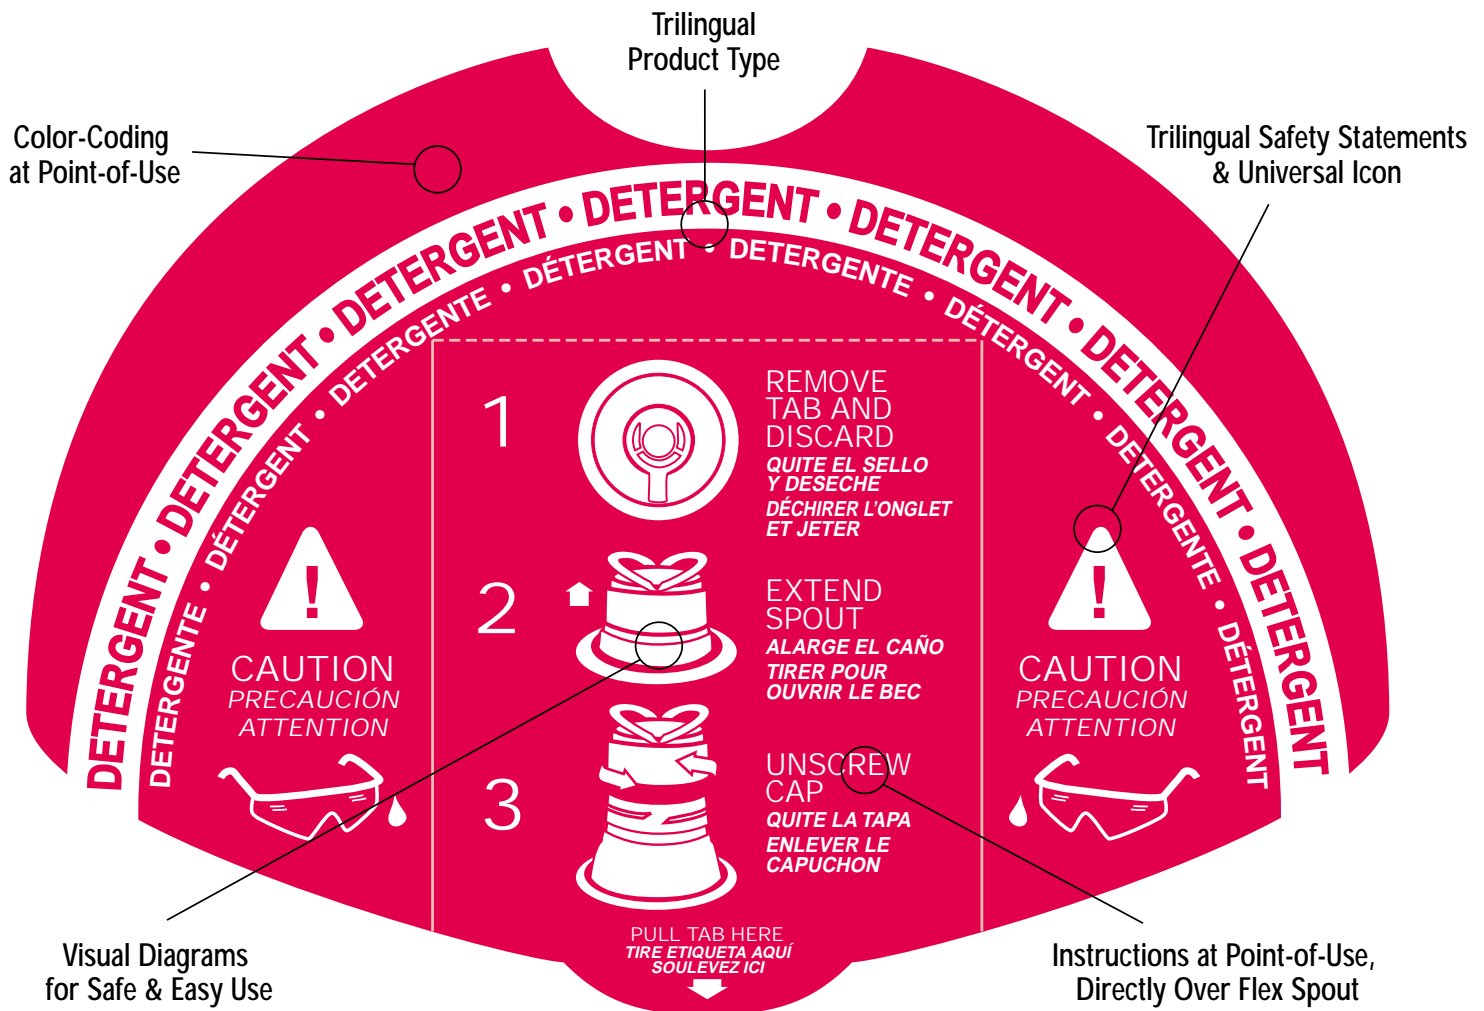

- Safety caution and icon for eye protection at point-of-use
- Multi-lingual product description at point-of-use
- Flex-spout diagram and instructions for safe opening and easy use
- Label color matches with dispensing system equipment
- Label placement directly over flex spout ensures that employees will see the precautionary statements and product identification

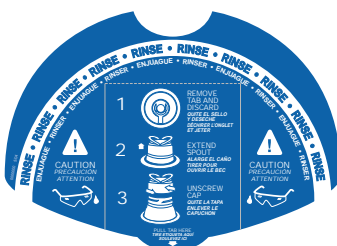

**Safer is Better and Together, We're Better Serving Your Customers**

# FEATURES & BENEFITS OF NEW LABEL SYSTEM

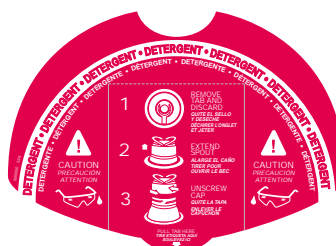

Using trilingual text combined with illustrations and icons, the Product Recognition Safety Label puts all the information and color-coding right on top of the pail where it is most useful. In fact, the pail cannot be opened without the user folding the safety label out of the way.
